

ABSTRACT OF THE DISCLOSURE

A printing system comprises a first input source to store a first medium and a second input source to store at least one set of an ordered media. The set of ordered media comprises a plurality of sheets having different physical characteristics. A user interface includes an input device for a user to select a first part of the ordered media set to be used in a print job and a second unwanted part of the ordered media to be discarded. A shredder is connected to the printing system. A central processing unit is configured to receive input from the user interface and send the first part or the ordered media to a job output and the second part of the ordered media to the shredder.
